

GO Enrichment

Run the `render()` function below and everything will be run with report at end.

```
library(rmarkdown)
render("skeleton_GO.Rmd", "pdf_document", output_file = paste(sample1,"_",sample2,"_", "GO.pdf",sep=""))
```

Read in YAML guide

```
library(yaml)
yaml1 <- yaml.load_file("de.yaml")
sample1 <- yaml1$sample1
sample2 <- yaml1$sample2

sample1
```

```
## [1] "tf2aother"
```

```
sample2
```

```
## [1] "tf2bother"
```

```
library(goseq)
library(GO.db)
```

Setting up the DE table for GO analysis

File Input

Input the output from DE analysis. This is made for a list that includes only the significant genes.

```
sigOnly <- read.table(paste(sample1,"_",sample2,"_DE_sig.txt", sep=""), header = TRUE, fill = TRUE)
sigOnly$logFC <- as.numeric(as.character(sigOnly$logFC))
colnames(sigOnly)[1] <- "itag"
```

Subset

First I need to subset the list to up or down regulated, then add a new column that specifies 1. This column is needed for merging.

```
upITAG <- subset(sigOnly, logFC > 0, select = c(itag))
upITAG$up <- 1

downITAG <- subset(sigOnly, logFC < 0, select = c(itag))
downITAG$down <- 1

allITAG <- subset(sigOnly, select = c(itag))
allITAG$all <- 1
```

Merge I - with normalized ITAG length gene list

read in guide.

```
geneLength <- read.csv("../normalized_genes_length.csv")
head(geneLength)
```

```
##           itag length
## 1 Solyc00g005040.2.1   357
## 2 Solyc00g005050.2.1   588
## 3 Solyc00g005060.1.1   273
## 4 Solyc00g005070.1.1    81
## 5 Solyc00g005080.1.1   297
## 6 Solyc00g005150.1.1  1143
```

```
#isolate just the gene list
genes <- subset(geneLength, select = c(itag))
```

First merge each table to geneLength

```
upITAGmerge <- merge(genes, upITAG, by = "itag", all= TRUE)
downITAGmerge <- merge(genes, downITAG, by = "itag", all= TRUE)
allITAGmerge <- merge(genes, allITAG, by = "itag", all= TRUE)
```

Merge II - Merge them all together.

```
matrixGOupdown <- merge(upITAGmerge, downITAGmerge, by = "itag", all = TRUE)
matrixGOupdownall <- merge(matrixGOupdown, allITAG, by = "itag", all = TRUE)
matrixGO <- merge(matrixGOupdownall, geneLength, by = "itag", all = TRUE)
```

Clean Up

```
matrixGO[is.na(matrixGO)] <- 0
head(matrixGO)
```

```
##           itag up down all length
## 1 Solyc00g005040.2.1 0   0   0   357
## 2 Solyc00g005050.2.1 1   0   1   588
## 3 Solyc00g005060.1.1 0   0   0   273
## 4 Solyc00g005070.1.1 0   0   0    81
## 5 Solyc00g005080.1.1 0   0   0   297
## 6 Solyc00g005150.1.1 0   0   0  1143
```

This is if you want to write out the table of the GO matrix. `#write.table(matrixGO, "mydata.txt", sep=" ", quote= FALSE)`

GO enrichment

There is the input of the GOSlim categories. There are only two columns 1. itag and 2. go

```
pat <- matrixGO
head(pat)
```

```
##               itag up down all length
## 1 Solyc00g005040.2.1 0    0  0    357
## 2 Solyc00g005050.2.1 1    0  1    588
## 3 Solyc00g005060.1.1 0    0  0    273
## 4 Solyc00g005070.1.1 0    0  0     81
## 5 Solyc00g005080.1.1 0    0  0    297
## 6 Solyc00g005150.1.1 0    0  0   1143
```

```
cate <- read.table("../melted.GOTable.txt",header=TRUE)
head(cate)
```

```
##               itag               go
## 1 Solyc00g005000.2.1 GO:0006508
## 2 Solyc00g005040.2.1 GO:0005774
## 3 Solyc00g005050.2.1 GO:0005829
## 4 Solyc00g005080.1.1 GO:0005524
## 5 Solyc00g005130.1.1 GO:0006508
## 6 Solyc00g005150.1.1 GO:0003676
```

Subsetting for GO analysis

Specify the column you are interested in `pat$all` refers to all the DE gene regardless if they are up or down regulated. If you want to specify down regulated, specify `pat$down`. I am going to put this into a loop, where each time the loop goes through it will perform GO enrichment on all three types of lists of significant genes and then write them to a table.

```
sigType <- c("up", "down", "all")

for(type in sigType) {

  genes = as.integer(pat[,type])
  names(genes) = pat$itag
  table(genes)
  length(genes)

  pwf = nullp(genes,bias.data=pat$length)

  GO.wall = goseq(pwf, gene2cat = cate)
  head(GO.wall)

#This is going to correct for multiple testing. You can specify the p-value cut-off of GO categories y

  enriched.GO = GO.wall$category[p.adjust(GO.wall$over_represented_pvalue, method = "BH") < 0.05]

  enriched.GO
```

```

my.GO <- as.character(enriched.GO)
my.GO.table <- Term(my.GO)
my.GO.table
t <- as.matrix(my.GO.table)

print(type) #this is for the knitr document
print(t) #this is for the knitr document

write.table(t, file=paste(sample1,"_",sample2,"DE1_sigonly_",type,"_GO.txt", sep=""))
}

```

```

## Using manually entered categories.
## For 2937 genes, we could not find any categories. These genes will be excluded.
## To force their use, please run with use_genes_without_cat=T (see documentation).
## This was the default behavior for version 1.15.1 and earlier.
